Overview of California PATH’s Cooperative Truck Platooning Systems

Steven E. Shladover, Sc.D.
University of California PATH Program and Lawrence Berkeley National Laboratory
ARRB, September 2017
Outline

• What is truck platooning and why care about it?
• Background on prior truck platooning work
• PATH’s earlier truck platoon tests
• The current implementation – cooperative adaptive cruise control and close-formation platooning
What is truck platooning?

- Coordinated driving of clusters of heavy trucks using automatic control of their speed and separation (SAE Level 1 automation)
- Extension of adaptive cruise control (ACC), measuring truck separation using radar and controlling engine and brakes
- Addition of wireless vehicle-vehicle (V2V) communication to enable close coordination
- Loose coupling by cooperative ACC or tighter coupling with constant clearance gap
- Driver steers and watches for hazards
Why care about truck platooning?

• Significant energy savings from aerodynamic drafting
• More stable vehicle following dynamics, reducing traffic flow disturbances and saving additional energy and emissions
• Increased highway capacity and reduced congestion from improved traffic dynamics and shorter gaps
• (Potential) safety improvement
Truck Platoons are not new…

- CHAUFFEUR Project in Europe 1996-2004
- First U.S. project – PATH research for Caltrans demo 2000-2003
- German KONVOI Project 2005-9
- Japanese Energy ITS Project 2008-2013
- European SARTRE Project 2009-2012
- European Truck Platooning Challenge 2015-16
- European multi-brand truck platoon project from 2018
PATH History with Truck Platooning

• Demonstration project for California Department of Transportation 2000-2003
  – 2-truck platoon at gaps from 3 m – 10 m, with energy saving measurements

• Development project for FHWA Exploratory Advanced Research Project (EARP) 2007-11
  – 3-truck platoon at gaps from 4 m – 10m, with energy saving and maneuver tests

• Development project for FHWA EARP, 2014-17
  – 3-truck cooperative ACC system at time gaps from 0.6 s – 1.5 s

• Fuel economy enhancements and testing for U.S. Department of Energy, 2017--
2003 Tests of 2-Truck Platoon
2010 Tests of 3-Truck Platoon
The Current Truck Implementation

- SAE Level 1 automation – longitudinal control only (driver steers and monitors for hazards)
- Building on Volvo VNL series truck ACC system (using same radar and video sensors)
- Added 5.9 GHz dedicated short range communication (DSRC) radio for V2V data
- Added touch-screen tablet display to show status of trucks and select gap settings
- Driver usage tested on California freeways at gaps of 0.6 s to 1.5 s (15 to 37 m at 90 km/h truck speed limit)
V2V Communication/Cooperation

Radar & Video Camera

V2V Communication
System Elements

- Dual DSRC Antennas
- Video camera (production)
- 5 Hz GPS
- ACC radar (Production)
- Supplementary display
- PC-104 computer
- Emergency disengage button by driver
Driver Interface

Steering wheel stalk control
Display & Emergency Disengage Button

Driver-Vehicle Interface

Disengage Button
Supplementary Display
System Enhancements

• Wider range of gap settings implemented – from 4 m minimum fixed gap to 3 s maximum time gap (87 m at 65 mph)
  – Cooperative ACC at longer time gaps
  – Tightly-coupled platoon at shorter gaps

• Responses to cut-in vehicles between trucks
  – Performance trade-offs in rapidity of recovery vs. energy spent in more aggressive maneuvers
  – Need even earlier detection of cut-ins
Driving at 0.6 s Time Gap (2016)
Driving at 4 m Gap (August 2017)
Fuel Savings per Truck at 110 km/h

![Graph showing fuel savings per truck at 110 km/h with time gap and vehicle separation distance on the x-axis and individual vehicle fuel savings on the y-axis. The graph includes data from 3-Truck Platoon (2016) and 3-Truck Platoon (2017).]
